

Project Manager Report: README.md Update Analysis

Report for Project Manager

Executive Summary

This report analyzes a closed pull request by user 'Kinga-Jaworska' which updates the project's README.md file. The change removes the default Next.js boilerplate and adds a project-specific description, feature list, and simplified setup instructions for the 'Evidence App - BE'. This is a low-risk, high-value documentation improvement.

Key Changes

The pull request implements a complete overhaul of the main documentation file.

- Boilerplate Removal: 29 lines of default `create-next-app` content were deleted.
- Project-Specific Content: 10 lines were added, introducing the project title 'Evidence App - BE'.
- Feature Overview: A summary of application features was added, including Google login, task creation, and CSV report generation.
- Simplified Instructions: The setup process was condensed to two essential commands: `npm i` and `npm run dev`.

Risk Analysis

The overall risk is minimal as this is a documentation-only change with no impact on the application's source code or functionality.

- Instruction Ambiguity: The new setup instructions lack details on necessary environment variables (e.g., Google OAuth keys), which could slow down new developer onboarding.

- Content Inconsistency: The README is titled 'Evidence App - BE' (Back-End) but describes features from a Front-End perspective ('FE part... allows to:'). This may cause confusion about the repository's scope.

Action Items

To mitigate the identified risks and further improve project clarity, the following actions are recommended.

- Clarify Repository Scope: Create a task to revise the README to describe the back-end's role and its APIs, rather than the front-end's features.
- Enhance Setup Guide: Create a new issue to add a section for environment variables, including a sample `.env.example` file.
- Link to FE Repository: If a separate front-end repository exists, add a link to it in the README for context.

■ Recommended Test Scenarios

- Not applicable. This is a documentation-only change and requires no functional testing.

★ Recommendations

- No action is needed on the PR as it is already closed.
- Prioritize the creation of new issues for the 'Action Items' to ensure documentation is accurate and complete.
- Review project naming conventions to ensure repository titles ('BE') align with their content.
